Design and Realization of an Automated Drug Distribution System Based on Arduino

Sarra Bouzidi, Asmaa Tabti, Khalid Hachemi

Institute of Maintenance and Industrial Safety, University of Oran 2 Mohamed Ben Ahmed, Department of Instrumentation, speciality of industrial engineering

Abstract: This paper presents the design and the realization of an automated drug dispensing prototype system, of 16 types, this system was inspired by the French automaton 'ApotéKa' which uses the Free Fall flow-rack AS/RS (FF-flow-rack AS / RS).

The system realized is based on servomotors to provoke the free fall of the drugs towards a conveyor that transport them. The servomotors are piloted by a PCA968 module which is controlled by Arduino Mega2560 through PC, the presence or absence of the boxes in the bins is detected by an infrared obstacle sensor.

Keywords: flow-rack AS/RS, Free Fall, drug dispensing, Servomotors, Arduino, controlled.

1. Introduction

Automation is developing more and more within pharmacies, Automated drug dispensing systems (ADDSs) have been utilized in various pharmacies over the last ten years[1], For instance Over the past decade, the use of this technology in hospital pharmacies has been on the rise with 97% of US hospital pharmacies using ADS as of 2014 [2], Due to the various advantages offered by these systems, in [3] the authors reported that ADDSs are substituting a few regular, time-consuming filling practices by increasing precision, enhancing productivity, and reducing medication errors, Indeed, despite a crucial period for the profession, during which the reduction of costs is the main concern of the incumbents, Automation companies do their best proposing solutions adapted to all types of pharmacies; small, medium, large or shopping center (with their large stock width), At certain points they knew how to adapt to the growing needs of pharmacists moving towards more autonomous systems (automatic boxes, storage), more compact and less expensive, for that several technological solutions have appeared to automate drug dispensing, such as automated storage and retrieval system (AS/RS), with new variant free-fall-flow-rack AS/RS (APOTEKA) which introduced by Mekapharm [4].

The work method (storage and retrieval operation) of the FF-flow-rack AS/RS is as follows: The storage operation which is performed by a storage machine or an operator, where the products are handled from the pick-up station to store it in the adequate bin. The retrieval operation consists of two phases: The first one is the ejection of the product, where it is achieved by the excitement of the electromagnet of the bin containing the desired product. This will cause the free fall of the product on the transport conveyor. The second phase is the transport of this product by the conveyor until reaching the drop-off station [5].

For making the flow-rack AS/RS more effective many researches have been done, in [6] Sari et al presented mathematical models for the expected travel time for a flow-rack AS/RS, which used two (S/R) machines, After that, Sari [7] performed a comparative study between unit-load AS/RS and flow-rack AS/RS. The author considered two comparison parameters: space's use and travel time, and to decrease the travel time for the flow-rack AS/RS many researchers have proposed various methods, Hachemi and Alla [8] presented an optimization method of retrieval sequencing where the AS/RS was depicted by a colored Petri net model. By considering dual

cycle coupled with lower mid-point S/R crane dwell-point policy, Xu et al [9] has developed a continuous travel-time model for DC in 3D compact storage system; then, he has used the analytical models to optimize system dimensions.

The free-fall flow-rack AS/RS offers many advantages for example the reduction of average retrieval-travel time can reach 38%, when using the FF-flow-rack (Metahri and Hachemi [10]), this automatic system was put in place to allow pharmacies to win time preparing prescriptions and pick up the orders there after. It also reduces errors knowing that dispensing errors are common, often go undetected, and can have serious consequences [10], Two studies [11], [12] on pharmacy-based automatic dispensing devices showed a decrease in dispensing errors.

The presented system is a practical study that explains the design and realization of an automated drug distribution system which is an AS / RS free-fall flow-rack, with optimal costs when based on the Arduino. The rest of the paper is organized as follows: In Section 2, we present our system description, programming in Section 3, the Final realization of the system in Section 4, and the conclusion in section 5.

2. System Description

Our system was inspired from the French automaton 'ApotéKa'; we chose to pilot it with Arduino which is less expensive than a programmable logic controller. We made a prototype system to ensure the distribution of 16 types of medication (16 lockers), automatically by a computer, which consists of sending the data via the serial port to the Arduino in the form of a data frame containing the necessary information such as the name of the locker and the number of boxes to distribute From this data frame, the Arduino controls servo motors (provoke drug to descend in free fall) through an interface, the conveyor is also run in order to finalize the operation of the Distribution.

2.1. System components

To achieve our goal, we used different equipment and materials:

A flow rack about 77 cm high and 50 cm deep, of 16 types of medication (16 lockers), grouping together a set of products .The system contains four trays per line with different lengths depending on the type of medication: (Locker 1: 10 cm length, Locker 2: 12 cm length, Locker 3: 13 cm length, Locker 4: 12 cm length).About the angle of inclination of the lockers we chose 30 degrees, allowing rapid drug sliding to make the system more efficient. (Fig. 1.)

Fig. 1. Flow rack design in 3D.

 Conveyor which is necessary in order to bring medication near counters, it is a conveyor belt type. (Fig. 2., Fig. 3.)

Fig. 2. Conveyor design in 3D.

Fig. 3. Conveyor in real picture.

Running and stopping of the conveyor are controlled by a DC motor, and must relate to 1 channel 5v relay module controlling the motor which has a voltage 12 v much higher than what the Arduino could accept (5v).

- Servomotors (Sg90) which rotate at a determined angle causes the free fall of medication, we chose this component for two reasons: the precision of rotation, it will be able to actuate heavy "limbs" because it is powerful.
- 4 channel infrared obstacle sensor, to find out if a locker requires refilling on a placed infrared obstacle sensor that detect the presence of the box (the channel to be filled is displayed on the control computer).
- Electronic circuit (PCA968 Servo Driver + Arduino mega), The PCA9685 module is a better solution which is to use a separate servo driver board. This will offload the task of sending PWM messages to the servos, which will allow our Arduino to do better things on the one hand; on the other hand we avoid the electrical risks that can destroy the Arduino board. The PCA9685 is powered by an external voltage source, for this we used an 'AC 100-240v 50/60 Hz' power supply of 5v / 2 A.
- Cables type of '22 AWG 4 p' to establish connections between the elements of the system.

2.2. Connections and simulations

2.2.1. Arduino board with PCA9685 and servomotors

We used the PCA9685 board to control the 16 servo motors since the PCA9685 card contains the I2C bus which shares the same SCL / SDA signals. The wiring is relatively simple, we have connected the 16 servo motors on the 16 ports of the PCA9685 controller and the latter has connected to Arduino on:

- Digital20: with SDA
- Digital 21: with SCL to establish an I2C communication.
- +5V : with Vcc
- GND: with GND to have a common ground between the PCA9685 module and Arduino.

The logic of the PCA9685 is supplied via the VCC pin (+ 5V). If the latter is not connected, the logic part of the circuit is not powered, so there is no control circuit.

We simulated our wiring diagram on in PROTEUS which allowed us to observe if there are any faults in the connection and to be able to remedy any problems that we can face without danger, as schematically indicated in Fig. 4.

Fig. 4. The Simulation in PROTEUS.

2.2.2. Arduino board with 4-channel infrared obstacle sensor The sensor connection with Arduino is like the following Fig. 5.

Fig. 5. Connection between Arduino with the sensor in PROTEUS.

Table. 1. Shows the connection of the transmitter module with the receiver:

The Transmitter	The receiver
Vcc	Vcc
GND	GND
OUT	OUT

Table. 1. Connection transmitter/receiver.

The receiver	The Arduino
Vcc	+5v
GND	GND
OUT1	Digital OUT
OUT2	Digital OUT
OUT3	Digital OUT
OUT4	Digital OUT

Table. 2. Shows the connection of the receiver module with the Arduino:

Table. 2. Connection receiver/Arduino.

2.2.3. The Arduino board with the DC motor and relay

The connection between the Arduino, DC motor and relay in Fig. 6.

Fig. 6. Connection between Arduino, the DC motor and relay in PROTEUS.

Table. 3	3.	Shows the	connection	of relays	with Arduino:
----------	----	-----------	------------	-----------	---------------

Relay	Arduino
Vcc	+5V
GND	GND
OUT	Digital OUT

Table. 3. Connection relay/Arduino.

3. Programmation

To clip the PCA9685 module code with the Arduino we have to use the library Adafruit_PWMServoDriver.h: #include <Adafruit_PWMServoDriver.h>

To use the library ${\bf Adafruit_PWMServoDriver.h}$, we must first declare :

- Minimum and maximum pulse width
- Default pulse width and frequency (Fig. 7.)

1	mequ		
	#define	MIN_PULSE_WIDTH	650
	#define	MAX_PULSE_WIDTH	2350
	#define	DEFAULT_PULSE_WIDTH	1500
	#define	FREQUENCY	60

Fig. 7. Pulse width and frequency declaration.

Also the declaration of variables: (Fig. 8.)

                   INPUT);
pinMode(cap13,
                   INPUT):
pinMode(cap14,
                   INPUT);
pinMode(cap15,
pinMode(cap16,
                   INPUT):
                  INPUT);
pinMode(moteur, OUTPUT);
```

Fig. 9. Defining of input and output.

The program has established a connection with the serial monitor to read the received data, it receives a character frame 'a' until 'q' which indicates the name of the locker (servo), and between each alphabet we find a number it is a counter associated with each servo which indicated the number of servo movements(number of products to distribute). (Fig. 10.)

Fig. 10. Creating of the Data frame.

Once the program receives the data frame, each servo will move depending on its counter. (Fig. 11.)

<pre>if (cmp1 < A) { pwm.setFWM(0, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFWM(0, 0, pulseWidth(anglemax)); delay(TIM); cmp1++; } if (cmp2 < B) { pwm.setFWM(1, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFWM(1, 0, pulseWidth(anglemax)); delay(TIM); cmp2++; } if (cmp3 < C) { pwm.setFWM(2, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFWM(2, 0, pulseWidth(anglemax)); delay(TIM); if (cmp3 < C) { pwm.setFWM(2, 0, pulseWidth(anglemax)); delay(TIM); imm.setFWM(2, 0, pulseWidth(anglemax)); delay(TIM); cmp3++; } if (cmp4 < D) { pwm.setFWM(3, 0, pulseWidth(anglemin)); delay(TIM); </pre>	<pre>if (cmp7 < G) { pwm.setFWM(6, 0, pulseWidth(anglemin)); delay(TIM); pum.setFWM(6, 0, pulseWidth(anglemax)); delay(TIM); cmp7++; if (cmp5 < H) { pwm.setFWM(7, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFWM(7, 0, pulseWidth(anglemin)); delay(TIM); cmp9 < I) { pwm.setFWM(8, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFWM(8, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFWM(8, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFWM(8, 0, pulseWidth(anglemin)); delay(TIM); rmp9++;) if (cmp10 < J) { pwm.setFWM(9, 0, pulseWidth(anglemin)); delay(TIM); } </pre>	<pre>if (cmp13< M) { pwm.setFNM(12, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFNM(12, 0, pulseWidth(anglemax)); delay(TIM); cmp13++; if (cmp14 < N) { pwm.setFNM(13, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFNM(13, 0, pulseWidth(anglemax)); delay(TIM); cmp14++;) if (cmp15 < 0) { pwm.setFNM(14, 0, pulseWidth(anglemin)); delay(TIM); pwm.setFNM(14, 0, pulseWidth(anglemin)); delay(TIM); cmp15++;) if (cmp16 < P) { pwm.setFNM(15, 0, pulseWidth(anglemin)); delay(TIM); </pre>

<pre>pwm.setPNM(5, 0, pulseWidth(anglemax)); delay(TIM); cmp6++;)</pre>	<pre>delay(TIM); pwm.setPWM(11, 0, pulseWidth(anglemax)); delay(TIM); cmp12++;}</pre>	return analog_value; }

Fig. 11. Servomotors moving depending to counter.

To order the sensors we used the instruction digitalRead(cap1), this instruction reads either a high level ($\ll 1 \gg$ or HIGH) the case of the presence of boxes in the locker, either a low level ($\ll 0 \gg$ or LOW) the case of locker is empty.(Fig. 12.)

<pre>int detect = digitalRead(cap1);</pre>	<pre>int detectI = digitalRead(cap9);</pre>

Fig. 12. Sensor ordering.

To control the conveyor (the DC motor) we must use the instruction digitalWrite which sends either 5V (HIGH) on the spindle or 0V (LOW).

To operate the system, several adjustments, installations and configurations are necessary, among these we mention:

- Installation of servomotors.

- Installation of sensors: The sensors must be installed in the designated places (next to the servo motor) in order to detect the presence of the box in the lockers, then they must be connected to the Arduino.- Installation of the conveyor.

After installing the electronic boards, sensors, modules, actuators, it is necessary to make the connection with the Arduino board.

After completing the assembly on the model, the testing phase is necessary to ensure the proper functioning of the system, We sent the data via the serial port to the Arduino as a frame containing the necessary information (the name of the locker and the number of boxes dispensed) the servomotors are actuated and the number of boxes in each bin is shown in the serial monitor window as well as the detection results by the sensors, the real picture of overall system is shown in Fig. 13.

Fig. 13. Real picture of the system realized.

4. Conclusions

This paper has presented a practical study consist the conception and design of an automated drug dispensing prototype system, We could develop a program which controls by computer 16 servomotors driven using a PCA9685 module to cause the drugs to free fall to the conveyor. Then, we have installed infrared obstacle sensors to detect whether or not boxes are in the lockers, controlled and piloted a conveyor.

We looked to minimize the costs of realization of an automated drug dispensing system using an Arduino control instead of programmable *logic controller which* costs more. The interest of this practical study was double: On the one hand, it will constitute a realistic prototype allowing demonstrations for professionals who would like to acquire this system, and on the other hand it will serve as a didactic model for students in practical work in automation and human-machine interface design.
